                                                                                                                                                                                     The invention comprises a fusion protein that contains a modified transferrin (Tf) protein fused to a therapeutic protein/peptide (e.g. beta-interferon - IFN, gluased to a therapeutic protein/peptide if mimetic peptide - EMPI, T-20 and soluble toxin receptor). The fusion protein of the invention is useful for epitope tagging. The present an acid sequence represents a fragment of the human Tf protein.

Novel erythropoietin (EPO) peptide mimetic, having first modification of cysteine residue of EPO mimetic peptides (EMP)-1, to reduces disulfide bond formation, and second modification such that peptide exhibits EMP-1

Example 1; SEQ ID NO 8; 158pp; English

CC (EPM), comprising a modification of at least one cysteine residue of EPO CC mimetic peptide (EMP)-1 that substantially reduces disulfide bond CC formation, and a second modification such that the peptide exhibits EMP-1 CC activity. The first modification comprises the deletion or substitution CC of at least one cysteine residue in EMP-1, and the second modification of a linker group that is covalently bonded to the comprises the addition of a linker group that is covalently bonded to the CC cherminal amino acid or N-terminal amino acid of EMP-1. EPM peptides of CC the invention are useful for treating or preventing diseases, such as CC multiple sclerosis, brain tumor, skin cancer, hepatitis B, hepatitis C, CC anemia, beta-thalassemia, pregnancy or menstrual disease, bepatitis C, CC autoimmune disease, viral disease, metabolic disease, obesity, CC autoimmune disease, inflammatory disease, metabolic disease, obesity, CC disease, systemic microbial infection, cardiovascular disease, psychosis, genetic diseases, neurodegenerative diseases, disorders of hematopoietic cells, diseases, neurodegenerative diseases disorders of hematopoietic cells, diseases, diabetes, asthma, or HIV infections, CA light and transferrin. A fusion protein, with increased half life, comprising the comprising peptide and modified transferrin is used in the course of the The specification describes an erythropoietin (EPO) peptide mimetic (EPM), comprising a modification of at least one cysteine residue of invention.

                                                                                                                                                                                                                                                                                                            The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A CC polynucleotide of the invention may have a use in gene therapy. The human CC diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be CC used to diagnose a particular condition, disease or disorder associated CC with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorders, developmental disorder, endocrine CC disorder, neurological disorders, gastrointestinal disorders, or CC infections caused by virus, bacteria, fungi or parasite. The dithp CC molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline CC gene therapy. The present sequence represents a dithp protein of the CC invention. Note: The sequence represents a dithp protein of the printed specification, but was obtained in electronic format directly cc from WIPO at www.wipo.int/pct/en/sequences/listing.htm

Stevens KA,
Peralta CH,
                                                                                                                                                                                                                                                 disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.

                                                                                                                                                                                used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

                                                                                                                                                                                                                                                                                                                 The invention relates to novel human metal binding proteins (MBP) and encoding polynucleotides. The MBPs can be expressed by standard crecombinant methodology. The polypeptides and polynucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of MBP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. AIDS, callergies) and developmental (e.g. Hypothyroidism, Cushing's syndrome) conjectures, or infections. These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of MBP. The MBP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polynucleotide and compounds that specifically bind to or modulate the activity of the polypeptide. An microarray comprising different nucleotide molecules affixed at distinct physical locations on a solid substrate, where at least one nucleotide sequence specifically hybridizable with at least 30 contiguous nucleotides of the polypeptide is useful in monitoring or measuring protein-comprises a first oligonucleotide or polynucleotide sequence protein interactions, drug-target interactions, and gene expression contiguous nucleotides of the protein sequence represents a human MBP.

                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                                                                           The invention relates to novel diagnostic and therapeutic polynucleotides CC selected from one of the 2722 sequences defined in the specification. A CC polynucleotide of the invention may have a use in gene therapy. The human CC diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated CC with human molecules, e.g. cell proliferative disorder, endocrine CC disorder, neurological disorder, developmental disorders, or CC infections caused by virus, bacteria, fungi or parasite. The dithp CC molecules may also be used in genetic mapping, in identifying individuals CC from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline CC invention. Note: The sequence represents a dithp protein of the CC invention. Note: The sequence represents a dithp protein of the CC invention. Note: The sequence represents a dithp protein of the CC invention. Note: The sequence represents a dithp protein of the CC invention.                                                                                                                                           멼
                                                                                                                                                                    The invention relates to novel diagnostic and therapeutic polynucleotides celected from one of the 2722 sequences defined in the specification. A composition of the invention may have a use in gene therapy. The human composition diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, and corine commune/inflammatory disorders, gastrointestinal disorder, endocrine compositions caused by virus, bacteria, fungi or parasite. The dispersion or infections caused by virus, bacteria, fungi or parasite. The diship composition will be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this parent is not represented in the printed specification, but was obtained in electronic format directly composition of the printed specification, but was obtained in electronic format directly composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Harths...

                                                                                                                                                                                                                                                                                                                                                                                   GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.132

CURRENT APPLICATION NUMBER: US/09/248,796A

CURRENT FILING DATE: 1999-02-12

PRIOR APPLICATION NUMBER: US 60/074,725

PRIOR FILING DATE: 1998-02-13

PRIOR APPLICATION NUMBER: US 60/096,409

PRIOR FILING DATE: 1998-08-13

NUMBER OF SEQ ID NOS: 28208

SEQ ID NO 15968

LENGTH: 439

TYPE: PRT
